WPL Week 10: Databases - Part II

1. There are three tables in the database an author table has a first name, a last name and an email address. A publisher table has a name, a street address, a city, a state/ province, a country, and a Web site. A book table has a title and a publication date. It also has one or more authors (a many-to-many relationship with authors) and a single publisher (a one-to-many relationship - aka foreign key - to publishers). Design a form which populates and retrieves the information from the above database using Django.

The screenshot shows a web browser window with the address bar displaying `127.0.0.1:8000/library/add_author/`. The page title is "Add Author". The form contains three input fields: "First name:" with the value "John", "Last name:" with the value "Doe", and "Email:" with the value "john@example.com". Below the input fields is a button labeled "Add". At the bottom of the form is a link labeled "Back".

Add Author

Products

- **iPhone 17** - ₹82900.0
Latest Apple smartphone

[Add Product](#)

3. Create a web page with DropDownList, Textboxes and Buttons. Assume the table 'Human' with First name, Last name, Phone, Address and City as fields.

When the page is loaded, only first names will be displayed in the drop-down list. On selecting the name, other details will be displayed in the respective TextBoxes. On clicking the update button, the table will be updated with new entries made in the text box. On clicking the delete button, the selected record will be deleted from the table, and the DropDownList is refreshed.
